The Hygiene Trap

Scene 8 of 28: Bad breath, mapped

Routes

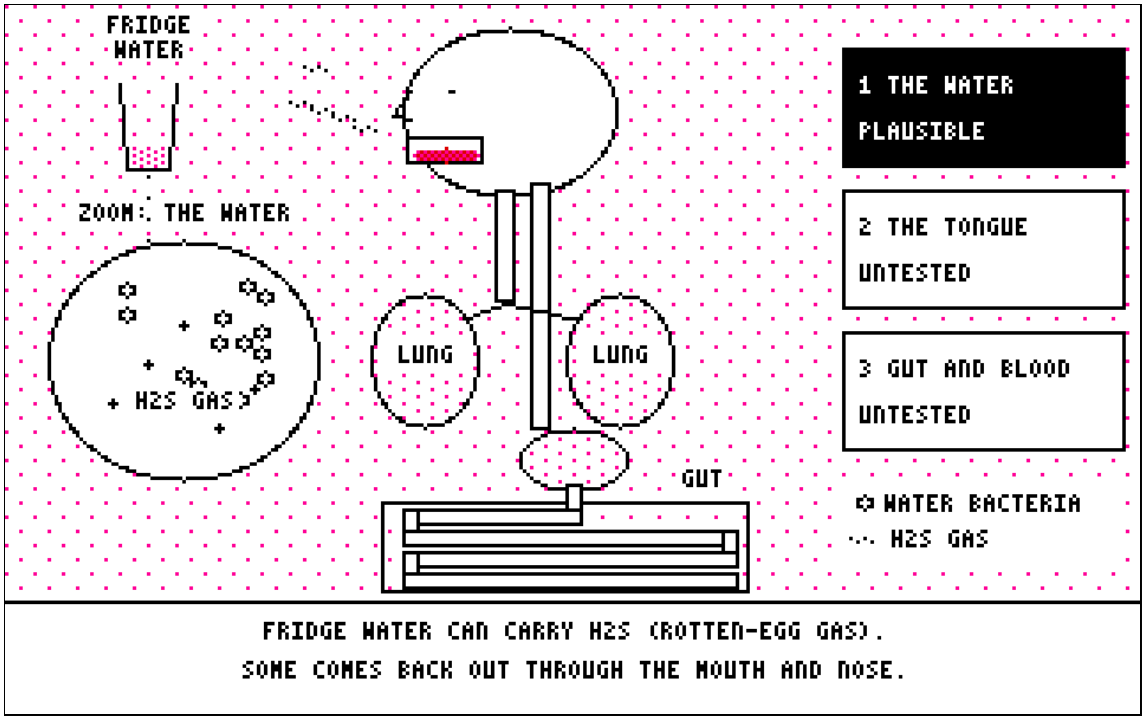

Frame 1. When the narrator says: “Three routes. All plausible, none yet measured in fridge water....”

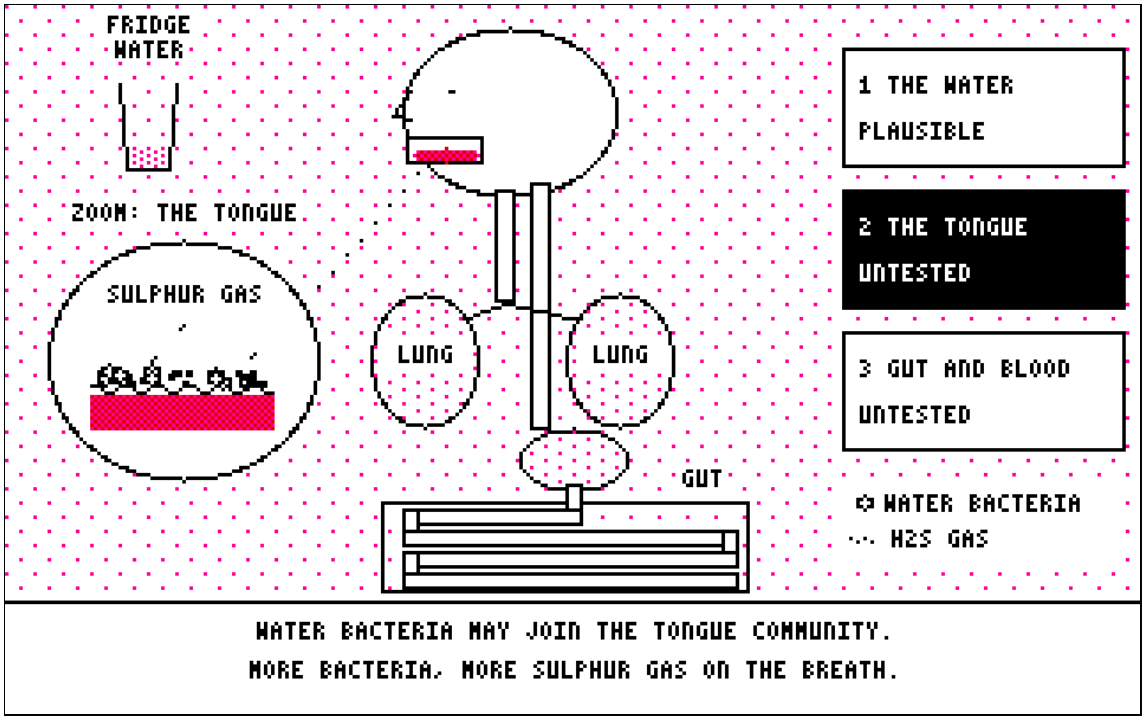

What the narrator says

1. There's a symptom people expect to hear about at this point: bad breath. Our hypothesis is that it's one of the first signs.
2. Most bad breath starts on the tongue, where bacteria break down proteins and release sulphur gases.
3. Water can carry hydrogen sulfide itself, the rotten-egg smell. Drink it, and some of that gas can come straight back out through your mouth and nose.
4. The tongue's bacteria are a community, and we think years of fridge water can change it. Nobody has measured that yet.
5. Gut hydrogen sulfide can also reach the breath through the blood, and we think fridge water can shift that too.
6. Three routes. All plausible, none yet measured in fridge water. We stand by the hypothesis, and the research can settle it.

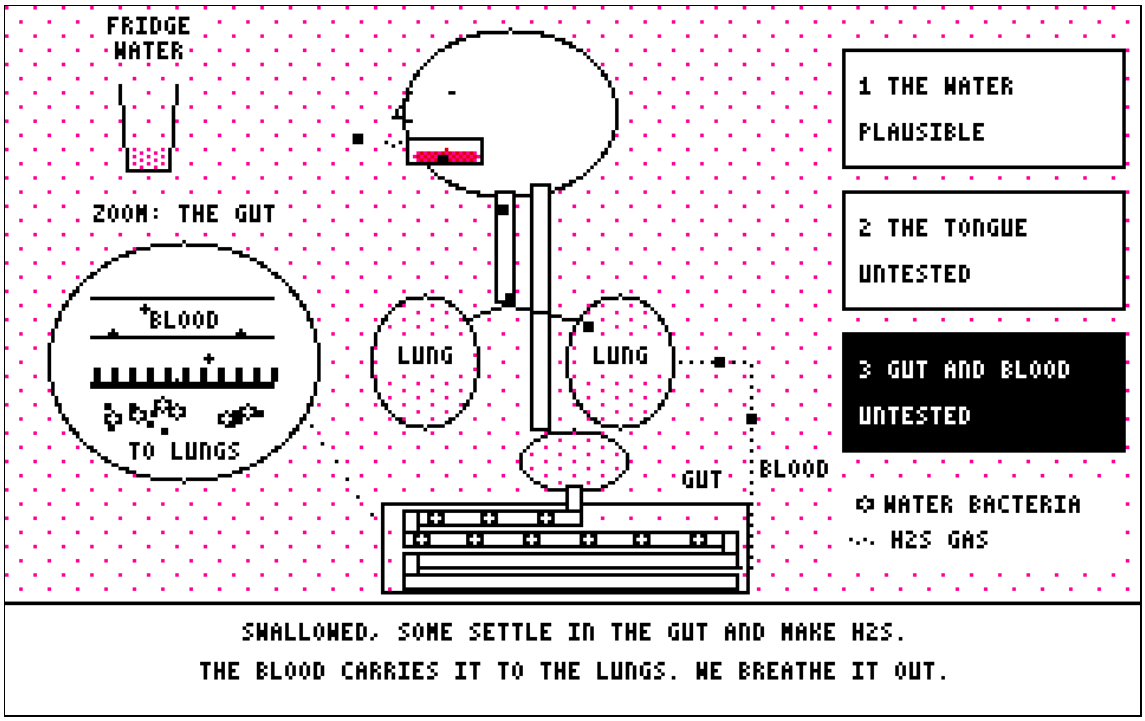

How it could happen

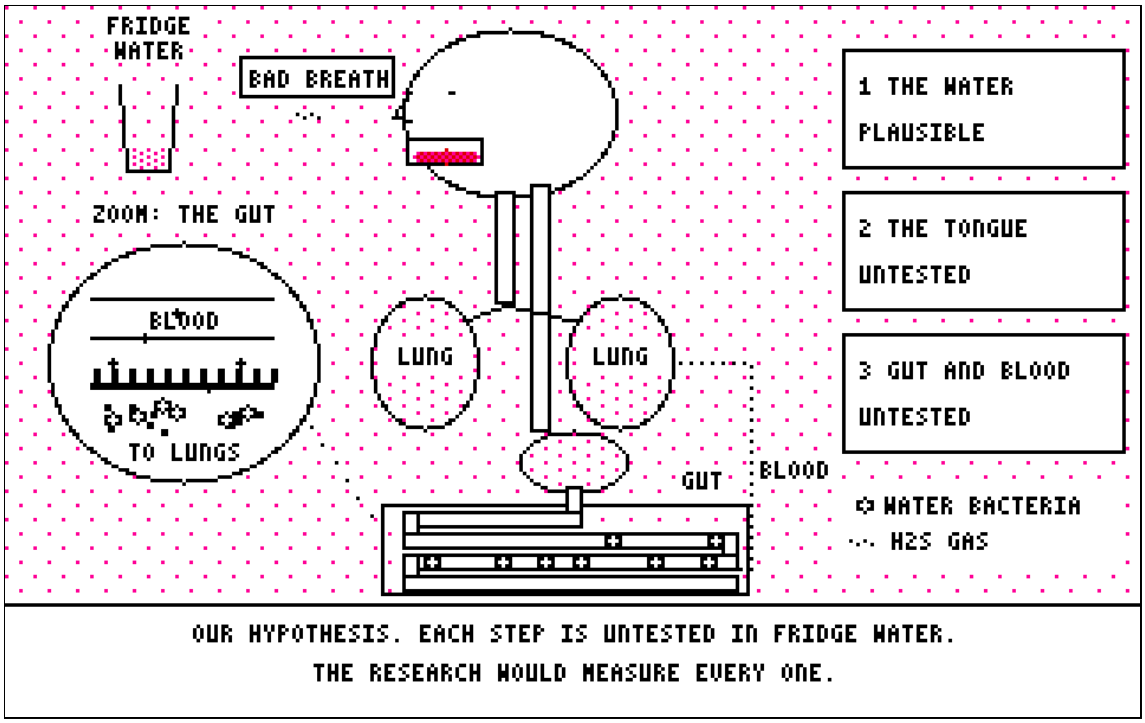

Frame 1. When the narrator says: “Here is the hypothesis, step by step. Fridge water carries…”

Frame 2. When the narrator says: “Then the tongue. We think bacteria from the water can…”

Frame 3. When the narrator says: “Then the gut. Swallowed bacteria that settle there can make…”

Frame 4. When the narrator says: “Each step is plausible. None has yet been tested for…”

What the narrator says

1. Here is the hypothesis, step by step. Fridge water carries far more bacteria than the tap, and bacteria in plumbing can make hydrogen sulfide, the rotten-egg gas. Drink it, and some of that gas can come straight back out through your mouth and nose.
2. Then the tongue. We think bacteria from the water can join the community that lives there, and a busier community makes more sulphur gas.

3. Then the gut. Swallowed bacteria that settle there can make hydrogen sulfide too. Some of the gas passes into the blood, the blood carries it to the lungs, and with every breath out, a little leaves.
4. Each step is plausible. None has yet been tested for bad breath. That's what the research is for.

Notes

- No study of fridge water and bad breath was found. All of it is our hypothesis. Gomez-Smith was checked at title level only.
