The Hygiene Trap

Scene 28 of 28: What you can do

What you can do

Frame 1. When the narrator says: “If symptoms don't go away, see a doctor or a...”

Frame 2. When the narrator says: “Back in the kitchen, the same person pours a glass...”

What the narrator says

1. So what can you do now? Start simple: cold tap water in a clean jug or bottle.

2. A jug filter is optional. It's a carbon filter too, so change it on time, wash the jug, and keep it cold.
3. If you keep the dispenser, flush it first thing, change the filter on schedule, and clean the spout and drip tray.
4. If you're buying a fridge, you can leave the dispenser out. Check the ice maker, which can have its own line.
5. If symptoms don't go away, see a doctor or a dentist. If anyone at home has a weak immune system, ask their doctor what's right for them.
6. And join in. Repeat the study in your own kitchen with the replication protocol, share the results, good or bad, and help us reach ten homes.
7. Back in the kitchen, the same person pours a glass from a clean jug. Whatever the research finds, that costs nothing.

References and notes

1. Briancesco R, Paduano S, Semproni M, et al. (2020). Behavior of Pseudomonas aeruginosa and Enterobacter aerogenes in Water from Filter Jugs. Int J Environ Res Public Health 17. PMID 33182311. doi:10.3390/ijerph17218263

Notes

- Jug filters can also grow bacteria under careless use (a laboratory simulation); regular cleaning and cartridge changes matter.
